Boing Network — Essentials

A plain-language snapshot of what Boing Network is today, what you can use, and what is still early.

Status: public **testnet** is live. **Mainnet is not live yet.**

What is Boing Network?

Boing Network is its own **Layer 1** blockchain — a new chain built from the ground up, not a copy of another network.

Today you can:

- Create a wallet and hold testnet BOING
- Swap tokens and explore NFTs / media on-chain
- Look up blocks, accounts, and activity on the explorer
- Get free testnet BOING from the faucet
- Join the community on Discord

Everything below runs on the **public testnet**. Values and assets there are for trying things out, not for real-world money.

Products

Product	What it is	Link
Boing Express	The wallet — create an account, send and receive, approve app actions	boing.express
Boing Finance	The app hub — swaps, pools, tokens, and NFTs on Boing (and related tools)	boing.finance
Boing Observer	The explorer — see blocks, accounts, tokens, QA decisions, and network activity	boing.observer
Faucet	Free testnet BOING so you can try the chain without buying anything	boing.network/faucet
Website	Home base — docs, testnet portal, status, and community links	boing.network

How apps talk to the chain

Apps do not “live inside” the chain. They ask a public gateway (the **RPC**) for balances, recent activity, and to submit the actions you approve in your wallet.

Public testnet gateway: https://testnet-rpc.boing.network/

In plain terms, that gateway lets apps:

- Check your balance and recent activity
- Look up blocks, tokens, and pools
- Send a transaction you already signed in Express
- Request faucet funds (via the faucet page)
- Work with on-chain media (with wallet help for larger files)

Deep method lists and integrator details: BOING-NETWORK-TECHNICAL-ESSENTIALS.md (technical companion) and RPC-API-SPEC.md (full method catalog).

What you can do today

- **Swap** — Trade tokens on Boing's native DEX through Finance (wallet connected).
- **NFTs & media** — Create and view NFTs; larger media can live on the chain itself (PutBlob), with wallet-assisted upload paths.
- **Quality Gate (QA)** — Before a new token or contract lands on the ledger, Boing runs transparent checks. Clear cases are allowed or rejected automatically; odd edge cases can go to a community review pool. Goal: cut down malicious or deceptive junk while still allowing playful meme / community projects.
- **Fees & staking (high level)** — Everyday actions use a small network fee. Staking and validator rewards are part of how the chain is designed to stay secure over time; on today's public testnet the setup is still early (see limits below).
- **Community** — Chat, feedback, and updates on Discord.

Deeper reading: SIX-PILLARS.md (why Boing prioritizes what it does) · QUALITY-ASSURANCE-NETWORK.md (QA in more detail) · TESTNET.md (how to join and use testnet).

Honest limits (today)

Be clear with yourself and others:

- This is a **public testnet**, not mainnet.
- The hosted chain is still **early** — for now, a **single hosted validator** runs the public network path people use day to day.
- Independent security audits are **not** finished.
- Features continue to ship and change; some Finance surfaces are still deepening (more pools, richer discovery, more staking UI).
- Testnet BOING has **no** real-world cash value.

When mainnet and a more decentralized validator set ship, this page will be updated.
